## Introduction

PM valves are pilot operated main valves for regulating pressure and temperature in refrigeration systems. PM main valves can be used on the high and low-pressure sides, in wet and dry suction lines, and in liquid lines without phase change (i.e. where no expansion takes place in the valve). The function of a PM valve depends solely on the pilot pressure applied to the valve, either from pilot valves or in the form of external pilot pressure. PM 1 has one connection for pilot pressure/pilot valve, while PM 3 has three pilot pressure/pilot valve connections. The associated Danfoss pilot valves can either be screwed direct into the main valve or be connected via an external pilot line. Several pilot valves can be used on one main valve to give a large number of different functions.

The PM valve top cover has a pressure gauge connection so that the inlet pressure can be measured when, for example, main valve function must be set or adjusted in relation to the system regulation performed by the pilot valves. The spindle in the top cover of the main PM valve can be used to manually open and close the valve (although PM 65-125 cannot be opened fully in this way).

The main valve bottom plug can be replaced by an AKS 45 electronic position indicator so that the position of the regulating cone can be read electronically.

## Features

- Can be used for all normal, non-flammable refrigerants, including R 717, and non-corrosive gases/liquids - assuming seals of the correct material are used.
- Large range of flanges with connection dimensions in accordance with standards: DIN, ANSI, SOC, SA and FPT.
- Performs as a multifunction valve when several pilot valves are connected to the same main valve.
- All pilot valves can be used on all sizes of PM main valves. They can be screwed direct into the main valve so that there is no need for weld or solder connections, or separate pilot lines.
- The valve has a pressure gauge connection so that inlet pressure can be measured.
- The valve has a built-in filter and a teflon seat to give excellent tightness.
- The PM main valve top cover can be oriented in any direction without the function of pilot valves being affected.
- The valve can be equipped with an AKS 45 electronic position indicator as an accessory.

**Design****Connections**

There is a very wide range of connection possibilities with PM main valves:

- Welding, DIN (2448)
- Welding, ANSI (B 36.10)
- Welding socket, ANSI (B 16.11)
- Solder connection, DIN (2856)
- Solder connection, ANSI (B 16.22)
- FPT internal thread, NPT (ANSI/ASME B 1.20.1)

PM main valves are designed as pilot operated valves that can be fully opened with a very small differential pressure (0.2 bar/ 2.9 psi).

The valve design means that it will only fully close in the direction of flow.

**Pressure Equipment Directive (PED)**

The PM-valves are approved in accordance with the European standard specified in the Pressure Equipment Directive and are CE marked.

For further details / restrictions - see Installation Instruction

PM 1 will accept one pilot valve mounted direct on the valve, while PM 3 will accept three pilot valves.

Two of the PM 3 pilot valve connections (S1 and S2) are series connected while the third pilot connection (P) is connected in parallel. Thus, with different combinations of pilot valves it is possible to obtain a very large number of different functions from one PM main valve.

The PM main valve has a logarithmic or v-shaped throttle cone that ensures optimum regulating accuracy.

The PM main valve top cover can be oriented in any direction without the function of pilot valves being affected.

**Valve body**

EN-GJS-400-18-LT

**Seals**

Do not contain asbestos.

Category	Article 3, paragraph 3	II	III

**Technical data****■ Refrigerants**

Can be used for all normal, non-flammable refrigerants, including R 717, and non-corrosive gases/liquids - assuming seals of the correct material are used.

Use with flammable hydrocarbons cannot be recommended; please contact Danfoss.

**■ Temperature range**

-60/+120°C (-76/+248°F).

**■ Surface**

PM 5 - 65:

The external surface is zinc-chromated to give good protection against corrosion.

PM 80 - 125:

The surface of the PM 80 - 125 is treated with a multi-layer painting.

**■ Pressure range**

The valve is designed for:

Max. working pressure: 28 bar g (406 psig)

Test pressure: 42 bar g (609 psig)

*Opening differential pressure:*

Fully open: Min. 0.2 bar g (min. 2.9 psig)

Max. (MOPD), solenoid valves only

(10 W a.c. and 20 W d.c.):

21 bar g (305 psig)

**■ Built-in filter**

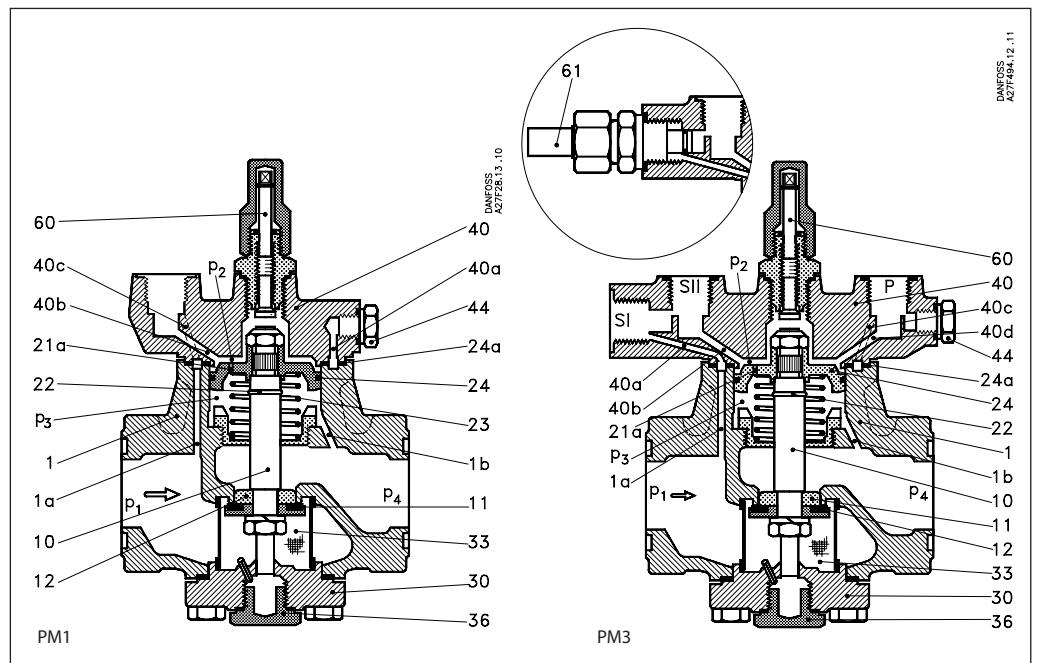

PM 5 - 40 mesh: 950 µ (18 mesh/in.)

PM 50 - 125 mesh: 1500 µ (10 mesh/in.)

- P. Pilot valve connection in parallel connection hole

The PM main valve is a pilot operated valve whose function is determined by the pilot valve used. The main valve with pilot valve(s) controls refrigerant flow by modulation or on/off in accordance with the pilot valve or main valve status.

The degree of opening of the main valve is determined by the pressure difference (differential pressure) between pressure  $p_2$ , which acts on top of the servo piston (24), and pressure  $p_3$ , which acts on the underside of the servo piston.

If this pressure difference is 0, the main valve will be fully closed.

If the pressure difference is 0.2 bar (2.9 psi) or more, the main valve will be fully open.

At pressure differences ( $p_2 - p_3$ ) between 0.07 bar (1 psi) and 0.2 bar (2.9 psi), the degree of opening will be correspondingly proportional.

The shape of the throttle cone (12) is logarithmic, which gives an ideal regulation characteristic to pilot operated main valves. Because of valve body channel (1b), pressure  $p_3$  acting on the underside of the servo piston (24) is equal to the main valve discharge pressure  $p_4$ .

The degree of opening of the main valve is thus controlled by the application of a pressure,  $p_2$ , on top of the servo piston which is equal to or greater than the discharge pressure,  $p_4$ .

$$p_2 = p_4 \sim \text{closed}$$

$$p_2 = p_4 + 0.2 \text{ bar (2.9 psi)} \sim \text{fully open}$$

$$p_4 \leq p_2 \leq p_4 + 0.2 \text{ bar (2.9 psi)} \sim \text{proportional degree of opening}$$

The maximum pressure,  $p_2$ , that can be built up on the top of the servo piston (24) normally corresponds to the pressure,  $p_1$ , acting on the main valve inlet side.

Inlet pressure  $p_1$  is led, via the drilled channels (1a, 40a, 40b, 40c, 40d) in the valve body (1) and cover (40) through the individual pilot valves and onto the top of the servo piston (24). The degree of opening of the individual pilot valves determines the size of pressure  $p_2$  and thus the degree of opening of the main valve, i.e. the equalisation hole (21a) in the servo piston (24) ensures that pressure  $p_2$  is balanced in accordance with the degree of opening of the pilot valve.

**Note:**

*When main valve type PM 3 is used with an external pilot connection (61), the internal pilot pressure will be shut off.*

The PM 1 main valve can be fitted with just one screwed-on pilot valve. The degree of opening of the main valve will be in accordance with the control status from the pilot valve.

PM 1 is fully closed when the pilot valve is fully closed and fully open when the pilot valve is fully open. Otherwise the degree of opening of the main valve is proportional to the degree of opening of the pilot valve.

The PM 3 main valve can be fitted with either one, two, or three pilot valves so that up to three regulating functions are possible.

**Design, function  
(continued)**

The relations between the functions of the screwed-in pilot valves are as follows:

- A. The pilot valves fitted in ports SI and SII are connected in series.  
The PM 3 main valve will be fully closed if just one of the series-connected pilot valves is closed. The main valve can only open if both pilot valves are fully open at the same time.
- B. The pilot valve fitted in port P is connected in parallel to the pilot valves in ports SI and SII.

The PM3 main valve will be fully open if the pilot valve in P is fully open, irrespective of the degree of opening of pilot valves SI and SII.

The PM 3 main valve will be fully closed if the pilot valve in P is fully closed and at least one of the valves in SI or SII is fully closed at the same time. The relation between the pilot valves in ports SI, SII and P is shown in the table above.

If the PM 3 is not fitted with three pilot valves, the unused port(s) must be sealed off with a blanking plug.

If the blanking plug is fitted as an assembled unit, A + B, the channels from the port concerned will be closed.

If only the top part, A, of the plug is fitted, the channels from the ports in question will be open. If the degree of opening of the PM main valve is not to be a function of the main valve inlet pressure, or if more than three regulating functions are required, ports SI, SII or P can be fitted with a nipple for the connection of external pilot pressure. This applies to both PM 1 and PM 3.

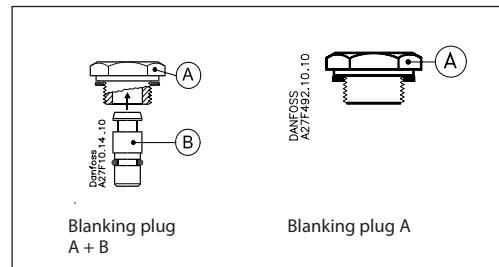

Pressure  $p_2$  on top of the servo piston will then be determined by the pressure to which the external pilot line is connected. The main valve function will be determined by the pilot valves fitted in that external pilot line. Pilot valves installed in external lines must be mounted in a type CVH housing.

Depending on the function of the pilot valves, the PM regulating characteristic becomes:

- on/off
- proportional
- integral or
- cascade.

PM main valves are therefore especially suitable for all forms of temperature and pressure regulating systems.

40	Cover	Low temperature, cast iron (spherical)	EN-GJS-400-18-LT EN 1563		
41	Gasket	Non-metal Non-asbestos			
42	Bolts for top cover	Stainless steel	A2-70	A2-70	TYPE 308
60	Manual operating spindle	Steel	9SMn28 1651	Type 2 R683/9	1213 SAE J 403
61	Cap for manual operating spindle	Steel	9SMn28 1651	Type 2 R683/9	1213 SAE J 403
62	Spindle seal	Steel	9SMn28 1651	Type 2 R683/9	1213 SAE J 403

**Flange connections**

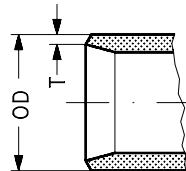

Danfoss flange sets are specially made for the Danfoss product range and must only be used for the purpose described.

Gaskets, bolts and nuts are supplied with the PM valve.

When ordering PM valves, first select the valve according to the capacity required. Then select the suitable flanges.

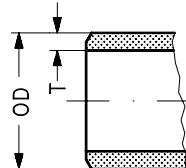

For use with valve type	Size mm	Size in.	OD mm	T mm	OD in.	T in.	Flange type	Code no.

PM 65	CVPP (HP)	<b>027F3199</b>

## Nominal capacities

**Liquid line**

**Nominal capacities****SI units**

Calculation example (R 134a capacities):

Running conditions in a plant are as follows:

 $T_e = -20^\circ\text{C}$   
 $Q_o = 300 \text{ kW}$   
 $T_{liq} = 10^\circ\text{C}$   
Max.  $\Delta P = 0.3 \text{ bar}$ The capacity table is based on nominal conditions ( $\Delta P = 0.2 \text{ bar}$ ,  $T_{liq} = 30^\circ\text{C}$ ).

The actual capacity must therefore be corrected to a nominal condition by multiplication with correction factors.

**Liquid line**Correction factor for  $\Delta P$  0.3 bar  $f_{\Delta P} = 0.82$ .Correction factor for liquid temperature  $f_{T_{liq}} = 0.82$ .

$$Q_n = Q_o \times f_{\Delta P} \times f_{T_{liq}} = 300 \times 0.82 \times 0.82 = 202 \text{ kW.}$$

From the capacity table a PM 25 with  $Q_n = 224 \text{ kW}$  is the correct selection for the application.**US units**

Calculation example (R 134a capacities):

Running conditions in a plant are as follows:

 $T_e = -20^\circ\text{F}$   
 $Q_o = 130 \text{ TR}$   
 $T_{liq} = 50^\circ\text{F}$   
Max.  $\Delta P = 5 \text{ psi}$ The capacity table is based on nominal conditions ( $\Delta P = 3 \text{ psi}$ ,  $T_{liq} = 90^\circ\text{F}$ )

The actual capacity must therefore be corrected to a nominal condition by multiplication with correction factors.

Correction factor for  $\Delta P$  5 psi,  $f_{\Delta P} = 0.79$ Correction factor for liquid temperature  $f_{T_{liq}} = 0.81$ .

$$Q_n = Q_o \times f_{\Delta P} \times f_{T_{liq}} = 130 \times 0.79 \times 0.81 = 83.2 \text{ TR}$$

From the capacity table a PM 32 with  $Q_n = 91 \text{ TR}$  is the correct selection for the application.

## Nominal capacities

## Pumped liquid line

## SI units

Calculation example (R 717 capacities):

Running conditions in a plant are as follows:

$$\begin{aligned} T_e &= -20^\circ\text{C} \\ Q_0 &= 180 \text{ kW} \\ \text{circulation rate} &= 3 \\ \text{Max. } \Delta P &= 0.3 \text{ bar} \end{aligned}$$

The capacity table is based on nominal conditions (pressure drop  $\Delta P = 0.3$  bar, circulation rate = 4).

The actual capacity must therefore be corrected to a nominal condition by multiplication with correction factors.

Correction factor for  $\Delta P$  0.3 bar  $f_{\Delta P} = 0.82$   
Correction factor for circulation rate  $f_{rec} = 0.75$ .

$$Q_n = Q_0 \times f_{\Delta P} \times f_{rec} = 180 \times 0.82 \times 0.75 = 111 \text{ kW}$$

From the capacity table a PM 15 with  $Q_n = 133$  kW is the correct selection for the application.

## US units

Calculation example (R 717 capacities):

Running conditions in a plant are as follows:

$$\begin{aligned} T_e &= -20^\circ\text{F} \\ Q_0 &= 130 \text{ TR} \\ \text{Circulation rate} &= 3 \\ \text{Max. } \Delta P &= 5 \text{ psi} \end{aligned}$$

The capacity table is based on nominal conditions (pressure drop  $\Delta P = 3$  psi, circulation rate = 4).

The actual capacity must therefore be corrected to a nominal condition by multiplication with correction factors.

Correction factor for  $\Delta P$  5 psi  $f_{\Delta P} = 0.79$   
Correction factor for circulation rate  $f_{rec} = 0.75$ .

$$Q_n = Q_0 \times f_{\Delta P} \times f_{rec} = 140 \times 0.79 \times 0.75 = 83 \text{ TR}$$

From the capacity table a PM 25 with  $Q_n = 114$  TR is the correct selection for the application.

## Nominal capacities

**Wet suction line**

**Nominal capacities****SI units**

Calculation example (R 717 capacities):

Running conditions in a plant are as follows:

$$\begin{aligned}T_e &= -20^\circ\text{C} \\Q_0 &= 100 \text{ kW} \\ \text{Circulation rate} &= 3 \\ \text{Max. } \Delta P &= 0.3 \text{ bar}\end{aligned}$$

The capacity table is based on nominal conditions (pressure drop  $\Delta P = 0.2$  bar, circulation rate = 4).

The actual capacity must therefore be corrected to a nominal condition by multiplication with correction factors.

**Wet suction line**Correction factor for  $\Delta P$  0.3 bar  $f_{\Delta P} = 0.82$ Correction factor for circulation rate  $f_{rec} = 0.9$ .

$$Q_n = Q_0 \times f_{\Delta P} \times f_{rec} = 100 \times 0.82 \times 0.9 = 73,8 \text{ kW.}$$

From the capacity table a PM 40 with  $Q_n = 107$  kW is the correct selection for the application.

**US units**

Calculation example (R 717 capacities):

Running conditions in a plant are as follows:

$$\begin{aligned}T_e &= -20^\circ\text{F} \\Q_0 &= 10 \text{ TR} \\ \text{Circulation rate} &= 3 \\ \text{Max. } \Delta P &= 5 \text{ psi}\end{aligned}$$

The capacity table is based on nominal conditions (pressure drop  $\Delta P = 3$  psi, circulation rate = 4).

The actual capacity must therefore be corrected to a nominal condition by multiplication with correction factors.

Correction factor for  $\Delta P$  5 psi  $f_{\Delta P} = 0.79$ Correction factor for circulation rate  $f_{rec} = 0.9$ .

$$Q_n = Q_0 \times f_{\Delta P} \times f_{rec} = 10 \times 0.79 \times 0.9 = 7.1 \text{ TR}$$

From the capacity table a PM 25 with  $Q_n = 10.0$  TR is the correct selection for the application.

## Nominal capacities

## Dry suction line

## Gravity

## DX

**Nominal capacities****SI units**

Calculation example (R 134a capacities):

Running conditions in a plant are as follows:

$$\begin{aligned}T_e &= -20^\circ\text{C} \\Q_0 &= 90 \text{ kW} \\T_{\text{liq}} &= 10^\circ\text{C} \\T_s &= 6^\circ\text{C} \\&\text{Max. } \Delta P = 0.3 \text{ bar}\end{aligned}$$

The capacity table is based on nominal conditions (pressure drop  $\Delta P = 0.2$  bar,  $T_{\text{liq}} = 30^\circ\text{C}$ ).

The actual capacity must therefore be corrected to a nominal condition by multiplication with correction factors.

**Dry suction line**Correction factor for  $\Delta P$  0.3 bar  $f_{\Delta P} = 0.82$ Correction factor for liquid temperature  $f_{T_{\text{liq}}} = 0.82$ Correction factor for superheat ( $T_s$ ) = 1,0

$$\begin{aligned}Q_n &= Q_0 \times f_{\Delta P} \times f_{T_{\text{liq}}} \times f_{T_s} \\&= 90 \times 0.82 \times 0.82 \times 1.0 = 60.5 \text{ kW}\end{aligned}$$

From the capacity table a PM 50 with  $Q_n = 64$  kW is the correct selection for the application.

**US units**

Calculation example (R 134a capacities):

Running conditions in a plant are as follows:

$$\begin{aligned}T_e &= 0^\circ\text{F} \\Q_0 &= 23 \text{ TR} \\T_{\text{liq}} &= 50^\circ\text{F} \\T_s &= 10^\circ\text{F} \\&\text{Max. } \Delta P = 5 \text{ psi}\end{aligned}$$

The capacity table is based on nominal conditions (pressure drop  $\Delta P = 3$  psi,  $T_{\text{liq}} = 90^\circ\text{F}$ ).

The actual capacity must therefore be corrected to a nominal condition by multiplication with correction factors.

Correction factor for  $\Delta P$  5 psi  $f_{\Delta P} = 0.79$ Correction factor for liquid temperature  $f_{T_{\text{liq}}} = 0.81$ Correction factor for superheat ( $T_s$ ) = 1,0

$$\begin{aligned}Q_n &= Q_0 \times f_{\Delta P} \times f_{T_{\text{liq}}} \times f_{T_s} \\&= 20 \times 0,79 \times 0,81 \times 1,0 = 12,6 \text{ TR}\end{aligned}$$

From the capacity table a PM 4 with  $Q_n = 13$  TR is the correct selection for the application.

## Nominal capacities

## Discharge line

**Nominal capacities****SI units**

Calculation example (R 717 capacities):

Running conditions in a plant are as follows:

$$\begin{aligned}T_e &= -20^\circ\text{C} \\Q_o &= 90 \text{ kW} \\T_{liq} &= 10^\circ\text{C} \\ \text{Max. } \Delta P &= 0.4 \text{ bar} \\T_{disch} &= 60^\circ\text{C}\end{aligned}$$

The capacity table is based on nominal conditions ( $\Delta P = 0.2 \text{ bar}$ ,  $T_{liq} = 30^\circ\text{C}$ ,  $P_{disch} = 12 \text{ bar}$ ,  $T_{disch} = 80^\circ\text{C}$ ).

The actual capacity must therefore be corrected to a nominal condition by multiplication with correction factors.

**Discharge line**

Correction factor for  $\Delta P 0.4 \text{ bar}$   $f_{\Delta P} = 0.72$ .

Correction factor for liquid temperature  $f_{T_{liq}} = 0.92$ .

Correction factor for  $T_{disch} 60^\circ\text{C}$ ,  $f_{disch} = 0.97$ .

Correction factor for  $P_{disch} 12 \text{ bar}$ ,  $f_{pdisch} = 1.0$ .

$$Q_n = Q_o \times f_{\Delta P} \times f_{T_{liq}} \times f_{T_{disch}} \times f_{pdisch} \\= 90 \times 0.72 \times 0.92 \times 0.97 \times 1.0 = 58 \text{ kW}$$

From the capacity table a PM 20 with  $Q_n = 80 \text{ kW}$  is the correct selection for the application.

**US units**

Calculation example (R 717 capacities):

Running conditions in a plant are as follows:

$$\begin{aligned}T_e &= 0^\circ\text{F} \\Q_o &= 18 \text{ TR} \\T_{liq} &= 50^\circ\text{F} \\ \text{Max. } \Delta P &= 7 \text{ psi} \\T_{disch} &= 120^\circ\text{F}\end{aligned}$$

The capacity table is based on nominal conditions ( $\Delta P = 3 \text{ psi}$ ,  $T_{liq} = 90^\circ\text{F}$ ,  $P_{disch} = 185 \text{ psi}$ ,  $T_{disch} = 180^\circ\text{F}$ ).

The actual capacity must therefore be corrected to a nominal condition by multiplication with correction factors.

Correction factor for  $\Delta P 7 \text{ psi}$   $f_{\Delta P} = 0.67$ .

Correction factor for liquid temperature  $f_{T_{liq}} = 0.92$ .

Correction factor for  $T_{disch} 120^\circ\text{F}$ ,  $f_{disch} = 0.95$ .

Correction factor for  $P_{disch} 185 \text{ psi}$ ,  $f_{pdisch} = 1.0$ .

$$Q_n = Q_o \times f_{\Delta P} \times f_{T_{liq}} \times f_{circ} \times f_{pdisch} \\= 18 \times 0.67 \times 0.92 \times 0.95 \times 1.0 = 10.5 \text{ TR}$$

From the capacity table a PM15 with  $Q_n = 13.1 \text{ TR}$  is the correct selection for the application.

\* 2°F below min. operating temperature.

Correction factor for  $\Delta P$  ( $f_{\Delta P}$ )

$\Delta P$ (psi)	Correction factor
3	1.00
5	0.79
7	0.67
10	0.56
15	0.47
20	0.41
30	0.35
60	0.28

Correction factor for discharge temperature ( $T_{disch}$ )

Discharge temperature	Correction factor
120°F	0.95
140°F	0.97
180°F	1.00
200°F	1.02
210°F	1.02
230°F	1.04
250°F	1.05

Correction factor for liquid temperature ( $T_{liq}$ )

Liquid temperature	Correction factor
-10°F	0.52
10°F	0.57
30°F	0.63
50°F	0.72
70°F	0.83
90°F	1.00
110°F	1.29
130°F	1.92

Correction factor for discharge pressure ( $P_{disch}$ )

$P_{disch}$ (psi)	Correction factor
185	1
240	0.87
300	0.78
